

I request the FCC deny any application authorizing the distribution of data over power lines (BPL). This technology does not offer any advantages over existing broadband distribution systems and has demonstrated serious interference problems. Cable and teleco companies have been rapidly expanding service coverage areas. The vast majority of Americans have broadband Internet access via DSL, cable, or both. For the few without access to cable or DSL, satellite offers a good substitute. BPL is not needed and authorizing its use would create noise pollution to existing users of HF spectrum that is unacceptable.
